(Received on $7^{\text {th }}$ October 2022, accepted in revised form $29^{\text {th }}$ June 2023)

#### Abstract

Summary: A convenient feasible protocol was developed for the preparation of novel tryptamine derivatives from evodiamine. After the general alkylation in N-13 and followed by the treatment of TFA in chloroform, a series of tryptamine derivatives 4a-i were successfully synthesized in a good yield, which were immediately cyclized to form alcohol 5 in the condition of $\mathrm{NaOH} /$ methanol.

## Graphical Abstract

Keywords: Evodiamine; Ring-opening; Tryptamine; Alkylation; Hydrolysis.

## Introduction

Tryptamine is a monoamine alkaloid with an indole ring structure, which is similar in structure to tryptophan. Tryptamine exists in the mammalian brain and functions as a neuromodulator or neurotransmitter. Similar to other trace amines, tryptamine binds to human trace amine related receptor 1 (TAAR1) as an agonist [1-5].

Tryptamine is a common skeleton in a group of compounds called collectively substituted tryptamine. This set includes many biologically active compounds, including neurotransmitters and psychedelics. The diverse pharmacological properties of tryptamine have attracted many medicinal chemists' attention to modify its structure [6-7].

Tryptamine 1

Fig. 1: Structure of Tryptamine, Evodiamine and Derivative 4 and 5.

There are so many methods to prepare tryptamine derivatives. Among of them, a classical organic reaction for the synthesis of tryptamine is called Abramovitch-Shapiro tryptamine synthesis [8] (Scheme 1).
*To whom all correspondence should be addressed.

Scheme-1: Abramovitch-Shapiro tryptamine synthesis for Tryptamine.

As a five-cycle fused compound, evodiamine can be easily obtained from natural plant Evodiae fructus. Owing to its pharmacological activities ${ }^{[9-14]}$ (Fig 1), the structural modification of evodiamine has attracted many medicinal chemists' attention. From the structural point of view, evodiamine also contains a tryptamine skeleton, which makes it possible to become a donor of tryptamine derivatives. Considering the similarity in structure, we envision that evodiamine can be converted into tryptamine derivatives under proper reaction conditions. Here we describe our research results.

## Experimental

## Materials

Melting points were determined in capillary and were uncorrected. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR were recorded on a Varian Unity INOVA 400 MHz spectrometer using TMS as an internal standard. MS spectrum (TOF) was measured on an Agilent 1100 Series VS (ES, 4000 V) Mass spectra. All reagents and solvents are reagent grade and were used directly without further purification.

A typical synthetic procedure for $\mathbf{3 a}(\mathbf{R}=\mathbf{B n})$
A mixture of evodiamine and ( $100 \mathrm{mg}, 0.33$ mmol ) and NaH ( $48 \mathrm{mg}, 6$ equiv.) in DMF ( 3 ml ) was stirred at room temperature for 10 min . To the suspension was added BnCl ( 0.042 ml , 1.1 equiv.) The reaction was heated to $80^{\circ} \mathrm{C}$ for 24 h . After being cooled to room temperature, the solvent was diluted in Ethyl acetate and water. The separated organic layer was dried over $\mathrm{MgSO}_{4}$. The solvent was evaporated completely under reduced pressure to afford the title compound 3a (71\%) as a yellow solid, m.p.143.2$145.1^{\circ} \mathrm{C}, \mathrm{R}_{\mathrm{f}}=0.47(\mathrm{PE}: \mathrm{EA}=3: 1) .{ }^{1} \mathrm{H}$ NMR $(400 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta: 8.07(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.62(\mathrm{~d}, J=7.8 \mathrm{~Hz}$, $1 \mathrm{H}), 7.45(\mathrm{t}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.34(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H})$, $7.25(\mathrm{~d}, J=7.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.21(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 7.16$ (d, $J=6.8 \mathrm{~Hz}, 4 \mathrm{H}), 7.12(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.98(\mathrm{~d}$, $J=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 5.79(\mathrm{~s}, 1 \mathrm{H}), 5.67(\mathrm{~d}, J=16.7 \mathrm{~Hz}, 1 \mathrm{H})$, 5.42 (d, $J=16.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.88(\mathrm{dd}, J=13.4,4.4 \mathrm{~Hz}$, 1 H ), 3.17 (td, $J=12.3,3.9 \mathrm{~Hz}, 1 \mathrm{H}$ ), 3.04 (dd, $J=15.2$, $3.7 \mathrm{~Hz}, 1 \mathrm{H}), 2.94-2.88(\mathrm{~m}, 1 \mathrm{H}), 2.35(\mathrm{~s}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta: 164.54,150.73,137.69,132.87$,

## Results and Discussion

Evodiamine can be easily converted into tryptamine derivatives 5 according to our previous
synthetic work [15], which is outlined in Scheme 1. Thus, evodiamine was reacted with alkyl halides upon treatment of sodium hydride to give $\mathrm{N}-13$ substituted evodiamine $\mathbf{3}$ in good yield. When compound $\mathbf{3}$ was treated with TFA, ring C was smoothly opened and led to the formation of urea alcohol 5 in reasonable yield.

Scheme-1: Previous synthetic route for derivatives 5.
However, when we investigate this rearrangement reaction again, an interesting thing occurred in the second step. It was found that the use of base or not will lead to different reaction results in the workup condition. If no base was used, a novel full ring-opening aldehyde 4 will be obtained, which is quite different from our previous reported compound 5 (Scheme 2). Compound 5 is actually difficult to synthesize by the traditional procedure from the starting material of tryptamine because of its unique urea alcohol structure.

Scheme-2: Synthetic route for the new tryptamine derivatives 4 and 5.

The structure of ring opening of tryptamine derivatives 4 was firstly identified by ${ }^{1} \mathrm{HNMR}$, ${ }^{13}$ CNMR and MS spectrum. Both of ${ }^{1}$ HNMR and ${ }^{13}$ CNMR clearly indicate the existence of a pair of isomers. From the structure to see, they are probably rotamers due to the two amide functions. But many of the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{CNMRs}$ indicate a single set of resonances indicating a favoured rotamer in solution.

The exact structure of key intermediate tryptamine aldehyde 4 was determined by X-ray. The
product of $\mathbf{4 h}$ ( $\mathrm{R}=\mathrm{n}$-heptyl) was selected as an example, which was recrystallized from dichloromethane and methanol to give colorless crystals suitable for single-crystal X-ray diffraction. A suitable crystal was selected and recorded on a Super Nova, Dual, Cu at zero, Atlas S2 diffractometer. The crystal was kept at 149.99 (10) K during data collection. Crystal Data for $\mathrm{C}_{26} \mathrm{H}_{33} \mathrm{~N}_{3} \mathrm{O}_{2}(M=419.55 \mathrm{~g} / \mathrm{mol})$ : triclinic, space group P-1, $a=5.07250(10) \AA, b=$ 17.4363(8) $\AA, c=27.5310(9) \AA, \alpha=74.714(3), \beta=$ 86.781(2), $\gamma=82.804(3), V=2329.67(14) \AA^{3}, Z=4, T$ $=149.99(10) \mathrm{K}, \mu(\mathrm{Mo} \mathrm{K} \alpha)=0.599 \mathrm{~mm}^{-1}$, $\rho$ calc $=$
$1.196 \mathrm{~g} / \mathrm{cm}^{3}$, reflections measured $=15997,(5.29 \leq 2 \Theta$ $\leq 147.588$ ), Independent reflections $=9125\left(R_{\text {int }}=\right.$ $0.0395, \mathrm{R}_{\text {sigma }}=0.0569$ ) which were used in all calculations. The final $R_{1}$ was 0.0669 (I $>2 \sigma(\mathrm{I})$ and $w R_{2}$ was 0.1766 (all data). And the structure of 4 h was shown in Fig 2.

The ring opening reaction of N13 benzylsubstituted evodiamine was optimized by different reaction conditions, including different acids, solvents and times. The results were summarized in table 1.

Fig. 2: $\quad$ X-ray for Compound $\mathbf{4 h}$.
Table-1: Process optimization of ring opening reaction.

It is interesting to find that both of hydrochloric acid and sulphuric acid cannot degrade
evodiamine at any concentration but only TFA can work. Meanwhile, an excessive amount of TFA in DCM would cause the ring-opening reaction of N13 evodiamine. The yield can be up to $56 \%$. When chloroform was used at reflux, the yield can be increased to $93 \%$.

This particular reaction result drives us to make extensive research on its mechanism. Considering of the electrophilicity of indole moiety, a possible reaction mechanism was proposed to explain the formation of the product (Scheme 3).

Based on this intriguing result, we expand the reaction substrates. Luckily, all of these substrates smoothly gave the designed ring-opened product 4a-h in good yield respectively. It was found that several functional groups, such as double bond $(\mathrm{C}=\mathrm{C})$, triple bond and nitrile ( CN ) can tolerate the reaction. Meanwhile, the ring opening reaction of N13unsubstituted evodiamine (2) proceeds also well to give the desired product. The yield of this reaction was range from $76 \%$ to $95 \%$. Table 2 summarized all of results for this reaction.

Scheme-3: Proposed TFA Mediated Mechanism for Tryptamine Derivatives 4.

Table-2: Structure characterization of compounds $\mathbf{3 a} \mathbf{- h}$ and $\mathbf{4 a} \mathbf{- h}$.

|  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Entry | R | Alkylation condition | Yield Product 3 | Degradation condition | Yield Product 4 |
| a | Bn | NaH/DMF/80 ${ }^{\circ} \mathrm{C}$ | 67\% | TFA/ $\mathrm{CHCl}_{3}$ | 93\% |
| b | $\mathrm{CH}_{3}$ | NaH/DMF/80 ${ }^{\circ} \mathrm{C}$ | 77\% | TFA/CHCl ${ }_{3}$ | 95\% |
| c | $\mathrm{CH}_{2} \mathrm{CH}_{3}$ | NaH/DMF/80 ${ }^{\circ} \mathrm{C}$ | 76\% | TFA/CHCl ${ }_{3}$ | 92\% |
| d | $\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}$ | NaH/DMF/80 ${ }^{\circ} \mathrm{C}$ | 52\% | TFA/ $\mathrm{CHCl}_{3}$ | 87\% |
| e | allyl | NaH/DMF/80 ${ }^{\circ} \mathrm{C}$ | 55\% | TFA/CHCl ${ }_{3}$ | 91\% |
| f | $=-\mathrm{CH}_{2}$ | NaH/DMF/80 ${ }^{\circ} \mathrm{C}$ | 71\% | TFA/ $\mathrm{CHCl}_{3}$ | 85\% |
| g | $\mathrm{CH}_{2} \mathrm{CN}$ | NaH/DMF/80 ${ }^{\circ} \mathrm{C}$ | 60\% | TFA/CHCl ${ }_{3}$ | 77\% |
| h | n-heptyl | NaH/DMF/80 ${ }^{\circ} \mathrm{C}$ | 36\% | TFA/CHCl ${ }_{3}$ | 93\% |
| i | H |  |  | TFA/ $\mathrm{CHCl}_{3}$ | 76\% |

Fig. 3: X-ray for Compound 5a $(\mathbf{R}=\mathbf{B n})$.

It is interesting to find that the aldehyde $\mathbf{4}$ can be easily cyclized to form cyclic alcohol 5 in a quantitative yield in the condition of $\mathrm{NaOH} / \mathrm{CH}_{3} \mathrm{OH}$ (Scheme 4).

The exact structure of cyclized product 5 was determined by X-ray. The product of 5a $(\mathrm{R}=$ benzyl $)$ was selected as an example, which was recrystallized from dichloromethane and methanol to give colorless crystals suitable for single-crystal X-ray diffraction. And the X-ray structure of $\mathbf{5 a} .2 \mathrm{HCl}$ was shown in Fig 3. The spectrum clearly indicates the existence of urea alcohol

Scheme-4: Cyclization of aldehyde 4 to form urea alcohol 5.

## Funding

The project was sponsored by Science and Technology Foundation of Guizhou Province
(QianKeHe ZhiCheng [2022]293), Guizhou Provincial Administration of Traditional Chinese Medicine (GZWKJ2023-238), Key Project of Guizhou Provincial Administration of Traditional Chinese Medicine (QZYY-2021-086), Science and Technology Foundation of Zunyi City (ZunyiKeHe HZ [2022]417).

## Acknowledgments

We thank for the financial support from Science and Technology Department of Guizhou Province and we are also grateful Dr. JY Zhang's useful explanation on HNMR and LC/MS spectra data.
